Statistics: Mean 17.195; Variance 56.541; scale 0.304

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                        factor-alpha (TNF-alpha) antibody (Ab) heavy Chain complementarity determining region 3 (CDR3).

The Ab dissociates from TNF-alpha with a Kd of 1x10 power -8 M or less and has a Koff rate constant of 1x10 power -3 s power -1 or less (both determined by surface plasmo resonance), and neutralises human TNF-alpha cytotoxicity in a standard in vitro 1929 assay with an IC50 of 1x10 power -7 M or less. The Ab, which inhibits TNF-alpha activity, can be used to treat sepsis, autoimmune diseases, e.g. rheumatoid arthritis, rheumatoid spondylltis, osteoarthritis, gouty arthritis, allergy, multiple sclerosis, autoimmune diseases, malignancy, pulmonary, intestinal, cardiac or inflammatory bone disorders, bone resorption disease, alcoholic, viral or fulminant hepatitis, coagulation disturbances, burns, reperfusion injury, keloid formation, scar tissue formation, pyrexia, periodontal disease, obesity and radiation toxicity. The Ab also inhibits TNF-alpha induced expression of endothelial cell leukocyte adhesion molecule-1 (ELAM-1) on human umbilical vein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match

High affinity antibodies against human TNF alpha - useful to inhibit
TNF alpha activity, e.g. to treat autoimmune diseases and cancer
TR alpha activity, e.g. to treat autoimmune diseases and cancer
SC Claim 20; Page 74; 102pp; English.

The present sequence is a novel anti-human tumour necrosis
factor-alpha (TNF-alpha) antibody (Ab) heavy chain complementarity
C determining region 3 (CDR3).

The Ab dissociates from TNF-alpha with a Kd of 1x10 power -8 M or
less (both determined by surface plasmon resonance), and
c neutralises human TNF-alpha cytotoxicity in a standard in vitro
L929 assay with an ICSO of 1x10 power -7 M or less. The Ab, which
inhibits TNF-alpha activity, can be used to treat sepsis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Query Match

CC The present sequence is a novel anti-human tumour necrosis factor-alpha (TNF-alpha) antibody (Ab) heavy chain variable region. CC The Ab dissociates from TNF-alpha with a Kd of 1x10 power -8 M or CC less and has a Koff rate constant of 1x10 power -3 s power -1 or CC less (both determined by surface plasmon resonance), and contralises human TNF-alpha cytotoxicity in a standard in vitro CC L929 assay with an IC50 of 1x10 power -7 M or less. The Ab, which CC inhibits TNF-alpha activity, can be used to treat sepsis. CC autoimmune diseases, e.g. rheumatoid arthritis, rheumatoid spondylitis, osteoarthritis, gouty arthritis, allergy, multiple CC syndrome, infectious diseases, malignancy, pulmonary, intestinal, CC cardiac or inflammatory bone disorders, bone resorption disease, cardiactor, viral or fulminant hepatitis, coagulation disturbances, human correficion injury when it has a correficion injury when it is a correstion.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              PI Allen DJ, Hoogenboom HRJM, Kaymakcalan Z, Labkovsky B, Allen DJ, Hoogenboom HRJM, Kaymakcalan Z, Labkovsky B, Billen DJ, Hoogenboom HRJM, Roberts AJ, Sakorafas P, Salfeld JG, Schoenhaut D, Vaughan TJ, White M, Wilton AJ; PJ Hankovich JA, McGuiness BT, Roberts AJ, Sakorafas P, Salfeld JG, Schoenhaut D, Vaughan TJ, White M, Wilton AJ; PJ Hankovich JG, Schoenhaut D, Vaughan TJ, White M, Wilton AJ; PJ High affinity antibodies against human TNF alpha - useful to inhibit TNF alpha activity, e.g. to treat autoimmune diseases and cancer Claim 20: Page 72: 102pp: English.

The present sequence is a novel anti-human tumour necrosis factor-alpha (TNF-alpha) antibody (Ab) heavy chain complementarity determining region 3 (CDR3).

The Ab dissociates from TNF-alpha with a Kd of 1x10 power -8 M or less and has a Koff rate constant of 1x10 power -3 s power -1 or less and has a Koff rate constant of 1x10 power -3 s power -1 or less (both determined by surface plasmon resonance), and neutralises human TNF-alpha cytotoxicity in a standard in vitro 1929 assay with an IC50 of 1x10 power -7 M or less. The Ab, which inhibits TNF-alpha activity, can be used to treat sepsis, autoimmune diseases, e.g. rheumatoid arthritis, rheumatoid spondylitis, osteoarthritis, gouty arthritis, allergy, multiple sclerosis, autoimmune diabetes, malignancy, pulmonary, intestinal, cardiac or inflammatory bone disorders, bone resorption disease, allocholic, viral or fulminant hepatitis, coagulation disturbances, burns, reperfusion injury, keloid formation, scar tissue formation,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The Ab dissociates from TNF-alpha with a Kd of 1x10 power -8 M or cless (both determined by surface plasmon resonance), and neutralises human TNF-alpha cytotoxicity in a standard in vitro 1p29 assay with an IC50 of 1x10 power -7 M or less. The Ab, which inhibits TNF-alpha activity, can be used to treat sepsis, autoimmune diseases, e.g. rheumatoid arthritis, rheumatoid spondylitis, osteoarthritis, gouty arthritis, allergy, multiple sclerosis, autoimmune diseases, alignancy, pulmonary, intestinal, cardiac or inflammatory bone disorders, bone resorption disease, alcoholic, viral or fulminant hepatitis, coagulation disturbances, pyrexia, periodontal disease, obesity and radiation toxicity. The Ab also inhibits TNF-alpha induced expression of endothelial cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Matches

                                                                                                                         The present sequence is a novel anti-human tumour necrosis
factor-alpha (TNR-alpha) antibody (Ab) heavy chain complementarity
determining region 3 (CDR3).
The Ab dissociates from TNF-alpha with a Kd of ix10 power -8 M or
less and has a Koff rate constant of 1x10 power -3 s power -1 or
less and has a Koff rate constant of 1x10 power -3 s power -1 or
less (both determined by surface plasmon resonance), and
neutralises human TNF-alpha cytotoxicity in a standard in vitro
less (both determined by surface plasmon resonance), and
inhibits TNF-alpha activity, can be used to treat sepsis,
autoimmune diseases, e.g. rheumatoid arthritis, rheumatoid
spondylitis, osteoarthritis, gouty arthritis, rheumatoid
spondylitis, osteoarthritis, gouty arthritis, allergy, multiple
sclerosis, autoimmune diseases, malignancy, pulmonary, intestinal,
cardiac or inflammatory bone disorders, bone resorption disease,
salcoholic, viral or fulminant hepatitis, coagulation disturbances,
burns, reperfusion injury, keloid formation, scar tissue formation,
pyrexia, periodontal disease, obesity and radiation toxicity. The
Ab also inhibits TNF-alpha induced expression of endothelial cell
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Best Loc

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      determining region 3 (CDM3).

The Ab dissociates from TNF-alpha with a Kd of 1x10 power -8 M or less and has a Koff rate constant of 1x10 power -3 s power -1 or less (both determined by surface plasmon resonance), and neutralises human TNF-alpha cytotoxicity in a standard in vitro 1929 assay with an IC50 of 1x10 power -7 M or less. The Ab, which inhibits TNF-alpha activity, can be used to treat sepsis, autoimmune diseases, e.g. rheumatoid arthritis, rheumatoid spondylitis, osteoarthritis, gouty arthritis, allergy, multiple sclerosis, autoimmune diseases, autoimmune uveitis or nephrotic syndrome, infectious diseases, malignancy, pulmonary, intestinal, cardiac or inflammatory bone disorders, bone recorption disease, alcoholic, viral or fulminant hepatitis, coagulation disturbances, burns, reperfusion injury, keloid formation, scar tissue formation, puravia pariodoral disease obscitus and redicates toxicity men

This protein comprises an endoglucanase of Bankia gouldi mix (clone 37GP2) that is capable of degrading carboxymethylcellulose and of hydrolysing the beta-1,4-glycosidic bonds in cellulose. It has homology to an endoglucanase of archaebacterium AEPIIIa (see
                                                                                                                                                                                                                                                                                                                                                                                                                                                Anti-TNF-alpha antibody heavy chain CDR3.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      homology to an endoglucanase of archaebacterium AEPIIIa (see W34985). It can be produced from native cells or from recombinant host cells, especially prokaryotic host cells transformed with a plasmid or virus-derived vector including the endoglucanase DNA (see T94195). 24 Endoglucanases (see W34986-W35008) are claimed. They can be used to degrade cellulose for the conversion of plant biomass into fuels and chemicals, for use in detergents, textiles, animal feed, waste treatment, and in the fruit juice and brewing industries for the clarification and extraction of juices.                                           PT TNF alpha activity, e.g. to treat autoimmune diseases and cancer PS Claim 9; Page 65; 102pp; English.

CT he present sequence is a novel anti-human tumour necrosis factor-alpha (TNF-alpha) antibody (Ab) heavy chain complementarity determining region 3 (CDR3).

CT he Ab dissociates from TNF-alpha with a Kd of 1x10 power -8 M or less and has a Koff rate constant of 1x10 power -3 s power -1 or less (both determined by surface plasmon resonance), and neutralises human TNF-alpha cytotoxicity in a standard in vitro class (both determined by surface plasmon resonance), and cultivity, can be used to treat sepsis, and this is the standard in vitro class and has a civity, can be used to treat sepsis, autoimmune diseases, e.g. rheumatoid arthritis, rheumatoid spondylltis, osteoarthritis, gouty arthritis, rheumatoid spondylltis, osteoarthritis, gouty arthritis, allergy, multiple csclerosis, autoimmune diseases, malignancy, pulmonary, intestinal, cardiac or inflammatory bone disorders, bone resorption disease, calcoholic, viral or fulminant hepatitis, coagulation disturbances, burns, reperfusion injury, keloid formation, scar tissue formation, pyrexia, periodontal disease, obesity and radiation toxicity. The Ab also inhibits TNF-alpha induced expression of endothelial cell vein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

(Novel rat spermatid chemoreceptors D-2, D-7, D-8, D-9 and G-X (W21662-66) represent a new family of putative chemosensory receptors that show homology to, but are different from, receptors deduced from isolated DNA fragments (T72287-91) isolated from rat genomic DNA. Recombinant receptor polypeptides can be produced in host cells for use as immunocontraceptives e.g. in vaccines, to detect specific antibodies which are indicative of autoimmune infertility of an animal by stimulating or inhibiting the binding of ligands to the receptors. Host cells can also be used as vaccines.

                                                                                                                                                                                                                                                                                                                                                                                                                                          Novel rat spermatid chemoreceptors D-2, D-7, D-8, D-9 and G-X (W21662-66) represent a new family of putative chemosensory receptors that show homology to, but are different from, receptors of the odorant receptor family. Their amino acid sequences were deduced from isolated DNA fragments (M7287-91) isolated from rat genomic DNA. Recombinant receptor polypeptides can be produced in host cells for use as immunocontraceptives e.g. in vaccines, to detect specific antibodies which are indicative of autoimmune infertility, or to screen for agents that can modulate the fertility of an animal by stimulating or inhibiting the binding of ligands to the receptors. Host cells can also be used as vaccines.
  p-hydroxyphenylpyruvate dioxygenase p-hydroxyphenylpyruvate dioxygenase; inhibitor tolerance; overexpression; herbicide.

                                                                                                                                                                                Plant p-hydroxy:phenyl:pyruvate dioxygenase enzyme - used to isolat compounds that inhibit the p-hydroxyphenylpyruvate dioxygenase rate of reaction for use as herbicides. Claim 4; Pages 49-51; 72pp; English.
The present sequence is Arabidopsis thaliana truncated p-hydroxyphenylpyruvate dioxygenase (p-HD). The p-HD cDNA can be used to impart tolerance to a compound that inhibits the rate of reaction of p-HD, or to overexpress p-HD. A compound that inhibits the activity of p-HD can be used as a herbicide.

MPsrch\_pp protein - protein database search, using Smith-Waterman algorithm

on: Thu Sep 2 12:43:10 1999; MasPar time 2.22 Seconds 153.061 Million cell updates/sec

ilar output not generated.

Description: Perfect Score: >US-08-599-226-32 (1-12) from US08599226.pep 78

Scoring table:

Sequence:

1 ASYLSTSSSLHY 12

PAM 150 Gap 15

Searched: 77977 seqs, 28268293 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: swiss-prot37 1:swissprot

Statistics: Mean 24.890; Variance 28.198; scale 0.883

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DOMAIN: THIS GENE CONTAINS TWO LARGE INSERTION SEQUENCES (IS1 AND CEU CLEP INTEIN) THAT DIVIDE THE CLEP GENE INTO THREE SEQUENCE DOMAINS. EACH INSERTION SEQUENCE FORMS A CONTINUOUS OPEN READING FRAME WITH ITS UPSTREAM AND DOWNSTREAM SEQUENCE DOMAINS. PTM: THIS PROTEIN UNDERGOES A PROTEIN SELF SPLICING THAT INVOLVES A POST-TRANSLATIONAL EXCISION OF THE THE INTERVENING REGION (INTEIN) FOLLOWED BY PEPTIDE LIGATION.

SIMILARITY: BELONGS TO PEPTIDASE FAMILY $14; ALSO KNOWN AS CLPP

Mean 24.334; Variance 30.685;

scale 0.793

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
